

SEVEN MONTHS, EIGHT DEVELOPERS

We stopped measuring
AI by speed. Here's what
we measured instead.

the whole ticket

"Integrate with Sensor X"

a link to the API docs, and ten lines on what we knew

That was about it.

**Developers got confused midway through.
QA had no acceptance criteria and no
context.**

And we skipped thinking about what the
integration meant for the product as
a whole.

We give the workflow the sensor, the docs and the blurb.

It reads the documentation with our code as context and builds a multi-card epic:

connect

ingest

render

It writes user stories for every sub-ticket, and the QA acceptance criteria to go with them.

Then it helps the developer turn that scope into a locked-in delivery plan.

Not one line of that is code.

It's the work that used to get done
badly, or not at all, before anyone
opened an editor.

50+

tickets built this way, and a low rejection rate.

Eight developers, seven months. No clean metric yet, and I say so in the post.

The time we saved writing code went back into planning what we write.
